Communication Protocol Specification and Verification Protocol verification is a process of checking whether the interactions of protocol entities, according to the protocol specification, do indeed satisfy certain properties or

conditions which may be either general (e.g., absence of deadlock) or specific to the particular protocol system directly derived from the specification. Communication Protocol Specification and Verification We develop service specifications of several representative protocols by using formal techniques from software engineering such as abstract machines and buffer histories. A survey of protocol verification methods and a bibliography indexed by key phrases are also provided. This report is part of the RAND Corporation note series. Formal Methods for Communication Protocol Specification ... As evidenced by the earlier chapters in this book, increasingly numerous and complex

communication protocols are being employed in distributed systems and computer networks of various types. The informal techniques used to design these protocols have been largely successful, but have also yielded a disturbing number of errors or unexpected and undesirable behavior in most protocols. Formal Methods for Protocol Specification and Validation ... Abstract Interest in more rigorous definition and analysis of communication protocols is increasing. This paper surveys the current state of the art in protocol specification and verification. Methods for specification such as abstract machines, Petri nets, formal languages, abstract data types, and programs are described and

compared. Formal Modeling of Communication

process. Communication Protocol Specification and Verification by ... A communication protocol is a system of rules that allow two or more entities of a communications system to transmit information via any kind of variation of a physical quantity. The protocol defines the rules, syntax, semantics and synchronization of communication and possible error recovery
